OOP PROJECT

Due Date: February 8th, 2pm

The OOP Project is an opportunity for bootcamp students to

- Begin to pull together a number of different things they've learned so far, including classes and polymorphism, user input, arrays and Lists, and exceptions;
- Work on a larger and more complicated case study than lab exercises as a prelude to the Final Project;
- Collaborate with teammates on a software project, experiencing the need for proper object-oriented design, documentation, and version control.

Every student will participate in this project in an assigned group. The majority of 3 days will be committed to the project (although outside work may still be necessary) and there will be multiple check-ins during those days to make sure groups are on-track.

The entire group will work together on one of the three projects. Take a little time to decide which one you want to tackle, but once you get started stick to that project—no turning back!

Possible projects:

- Point-of-Sale Terminal (a cash register/ordering terminal for someplace like a store, coffee shop, or fast-food restaurant)
- Library System
- Fitness Center

See the following pages for more information on each project. Please recognize that the descriptions are minimum versions; it's hoped each group will go beyond these requirements and incorporate features of interest to them.

By the end of the day, email the following to justin.jones@grandcircus.co and kristen.harrell@grandcircus.co

- **Your group's Github Repo**
- **Your group's Chosen Project**

Point of Sale TERMINAL

Write a cash register or self-service terminal for some kind of retail location. Obvious choices include a small store, a coffee shop, or a fast food restaurant.

- Your solution must include some kind of a product class with a name, category, description, and price for each item.
- 12 items minimum; stored in a list.
- Present a menu to the user and let them choose an item (by number or letter).
    - Allow the user to choose a quantity for the item ordered.
    - Give the user a line total (item price * quantity).
- Either through the menu or a separate question, allow them to re-display the menu and to complete the purchase.
- Give the subtotal, sales tax, and grand total. (Remember rounding issues the Math library will be handy!)
- Ask for payment type—cash, credit, or check
- For cash, ask for amount tendered and provide change.
- For check, get the check number.
- For credit, get the credit card number, expiration, and CVV.
- At the end, display a receipt with all items ordered, subtotal, grand total, and appropriate payment info.
- Return to the original menu for a new order. (Hint: you'll want an array or List to keep track of what's been ordered!)

Optional enhancements:

- (Moderate) Store your list of products in a text file and then include an option to add to the product list, which then outputs to the product file.
- (Buff) Do a push up every time you get an exception or error while running your code

LIBRARY TERMINAL

Write a console program which allows a user to search a library catalog and reserve books.

- Your solution must include some kind of a book class with a title, author, status, and due date if checked out.
    - Status should be On Shelf or Checked Out (or other statuses you can imagine).
- 12 items minimum; All stored in a list.
- Allow the user to:
    - Display the entire list of books. Format it nicely.
    - Search for a book by author.
    - Search for a book by title keyword.
    - Select a book from the list to check out.
        - If it's already checked out, let them know.
        - If not, check it out to them and set the due date to 2 weeks from today.
    - Return a book. (You can decide how that looks/what questions it asks.)

Optional enhancements:

- (Moderate) When the user quits, save the current library book list (including due dates and statuses) to the text file so the next time the program runs, it remembers.
- (Julius Caesar) Burn down the library of Alexandria and set human Civilization back by a few hundred years.

FITNESS CENTER

Write a console application for a fitness center to help manage members and membership options. At a minimum, this program should include:

- A class to hold basic details about Members (this class should eventually have at least 2 child classes) and hold the following details at a minimum:
    - id, name
    - an abstract method **void CheckIn(Club club)**
- A minimum of two child classes that represent a Single Club Member and Multi-Club Members (these members can visit various locations using the same membership). The classes should have the following:
    - Single Club Members: a variable that assigns them to a club. The CheckIn method throws an exception if it's not their club.
    - Multi-Club Members: a variable that stores their membership points. The CheckIn method adds to their membership points.
- A Club class that holds basic details about each fitness club, including at minimum:
    - name, address
- Allow users to:
    - Add members (both kinds), remove members or display member information.
    - Check a particular member in at a particular club. (Call the **CheckIn** method). Display a friendly error message if there is an exception. Don't let it crash the program.
    - Select a member and generate a bill of fees. Include membership points for Multi-Club Members.
- A main class which takes input from the user:
    - Asks a user if they want to select a club
    - Added members should be given the option to select from at least 4 fitness center locations or have the option to be a multi-club member.

Optional enhancements:

- (Easy/Medium) Allow new members to receive discounts if they sign up during certain time periods, explore the DateTime library for help with date and time.
- (Medium) Store clubs and members in text files.
- (Hard) Out Pizza the hut

PRESENTATIONS GUIDELINES

At the end of the project, we will present our project build to both staff and students. This doesn't need to be anything fancy, just a quick run through of your code.

Here's the rules for presentations each group should:

- Take 10 minutes maximum to present (including time for questions)
- Spend most of your time showing the project running
- Show off the most important objects and methods in the code (maybe one per team member)
- Don't go line by line, quick few sentence summaries are more than enough detail
- Share the presentation between group members roughly equally, everyone should speak
- Focus on the back-end, meaning transforming and manipulating data. We care about how the pizza is made, not how it looks. (EG: we check out a book update the due date in the book, and then update it in our File)
- Talk about the challenges you faced and how you worked through them as a group (Employers looove hearing about this exact kinda stuff)
